Being environmentally friendly has been a trend in recent years. Moving vehicles on the road causes emission of toxic carbon and damage the environment. IJI Vehicle has many years of professional experience in the design and assembly of bus chassis as well as the development of electric powered buses.

Putting safety as the top priority, IJI has established the research and development team since 2004 and has since gained tremendous experience and granted patents in several categories. Using the top graded steel material from China Steel in Taiwan to enhance the sturdiness of the bus body, IJI has also developed and successfully launched their own branded CITY BUS since 2007.

We are highly efficient in the integrated design and the entire operating system and created many new trendy look buses. We successfully introduced BRT bus with Volvo as the low chassis. With an accent of an European bus/coach, we are able to present to the commuting public a fresher appearance at all times.

Our electric bus is still under testing stage. Since electric buses are almost Government funded projects, our main priority is to reduce the total weight of the bus by at least 10% so that battery used can be much prolonged during transportation. Our prototype electric buses are now being tested in smaller townships in Taiwan. We hope to introduce them shortly to the international market.
